

Comparison of Chlorophyll Values in Blue-Green Algae Products

This graph compares the test results for chlorophyll levels of several samples from competitors' Upper Klamath Lake *Aphanizomenon flos-aquae* products with Simplicity Health's Super Blue Green Algae (<http://www.simplicityhealth.com/hfe>).

The competitive samples were purchased from retail or Internet sources and were analyzed according to the Japanese Food Hygiene Association method. The Simplicity Health data displayed represents the average chlorophyll level from three years summer's harvests, with those test results confirmed by an independent laboratory. This chlorophyll comparison clearly demonstrates the care Simplicity takes while harvesting and processing SBGA and the subsequent nutrient retention.
